History AutoCAD Activation Code was first developed by Jim Highsmith, and it was first commercially released on December 15, 1982, as a desktop app running on microcomputers with internal graphics controllers. At the time of AutoCAD Crack's release,

there were four major CAD programs: Aldus PageMaker and Sirius for desktop publishing, and AutoCAD Crack and Cadastre for CAD. The original idea behind AutoCAD Torrent Download was for the program to run as a desktop app on a personal computer (PC), much like PageMaker and Cadastre. Jim Highsmith was concerned

about creating the kind of graphic images that a desktop publisher could print using a dot-matrix printer. These images were often poorly prepared and could not be easily altered.

Autodesk's first release of AutoCAD was focused on users with PC-based graphics hardware. The program featured a color screen and an optical

scanner in the works. The program was released on a number of DOS-based microcomputers such as the Apple II, IIe, II GS, and Atari ST. However, the software was very slow, and it took nearly 24 hours to complete a two-hour design task. In addition, microcomputer users were required to upgrade their hard

drive to a floppy disk drive.

Aldus PageMaker was the first commercial CAD program with color screen graphics, so

Autodesk added color to

AutoCAD. In 1983, Autodesk incorporated LaserWriter, an

IBM laser printing device, to

AutoCAD. In 1984, Autodesk

added the optical scanner to the

product. With the introduction

of the optical scanner, AutoCAD users could scan into the computer. AutoCAD's earliest release used a 200-by-200 pixel window, which could be altered to 200, 600, or 1200 pixels. Also in 1984, Autodesk released AutoCAD LT, a simplified version of AutoCAD for desktop users who did not have

access to a personal computer. AutoCAD LT featured smaller and less-detailed graphics, and only 250,000 pixels. In 1985, Autodesk introduced AutoCAD R14, a revised version of the existing software. It was released on a number of DOS-based microcomputers. AutoCAD for the Atari ST came later, in 1986. In 1987, the

Microsoft Windows operating system was introduced.

Autodesk created their own version of Windows called Windows/OS. Windows/OS was used until 1994 for AutoCAD

1989 Wireless communication has been one of the most successful innovations in modern history. Recently, the number of subscribers to wireless communication services exceeded five billion and continues to grow quickly. The demand of wireless data traffic is rapidly increasing due to the growing popularity among

consumers and businesses of smart phones and other mobile data devices, such as tablets, “notebook” computers, netbooks, and laptops. In order to meet the high growth in mobile data traffic, improvements in radio interface efficiency and allocation of new spectrum are necessary. The next generation communications

system, 5G, is currently being standardized by the 3rd Generation Partnership Project (3GPP). 3GPP DL (downlink) is currently targeting a 3GPP LTE-A system with an initial release target of 3GPP Rel-12 in June-December 2012. It is recognized by the industry that the evolution of 5G will bring improvements in terms of:

Significantly increase in the peak data rate. For example, the target peak data rate is in the range of a few tens of gigabits per second (Gbps) in 3GPP Rel-12 and one hundred twenty Gbps in 3GPP Rel-14. Much higher energy efficiency. Improved system capacity. The target number of carriers is significantly higher than in LTE.

Much lower latency. The latency in 3GPP Rel-12 is typically a few milliseconds (ms) and can be as low as 100 ms in 3GPP Rel-14. Better coverage. Ability to handle much higher micro-cell and pico-cell load.

Rel-12/Rel-14 will focus more on macro-cell deployments with higher power base stations. One approach to 5G is to enhance the

current Rel-4/LTE technologies
with advanced features like
