Powder and liquid (sometimes called "aerosol") dispensers are well known in the art. In these dispensers, the source of a substance to be dispensed (e.g., a liquid, aerosol, etc.) is stored in a container and a movable actuator discharges the substance through an outlet and out of the container. One common type of such dispensers comprises a container, a movable actuator positioned within the container and a valve positioned between the container and the actuator. Typically, such a valve comprises a valve body having an inlet orifice and an outlet orifice. The inlet orifice is in fluid communication with the container and the outlet orifice is in fluid communication with the actuator. The valve body also typically includes a valve member that is moved to a closed position relative to the inlet orifice and the outlet orifice to seal off the container and actuator. The valve member is typically spring biased into the closed position. When actuation of the actuator moves the actuator to an open position relative to the container, the actuator acts on the valve member to open the inlet orifice and outlet orifice and allow the substance to be dispensed from the container and actuator, respectively. As an alternative to a spring-biased valve, one may use a pneumatic valve. Typically, such valves comprise a generally cylindrical housing having a central bore and a movable internal plunger positioned within the central bore. A surrounding valve body is typically disposed within the central bore of the housing. This valve body includes an inlet orifice in fluid communication with the central bore. The valve member is located between the inlet orifice and the central bore and is typically spring biased into a closed position. When actuation of the actuator moves the actuator to an open position relative to the container, the actuator acts on the valve member to open the inlet orifice and outlet orifice and allow the substance to be dispensed through the inlet orifice and outlet orifice, respectively. A valve actuator may be used to actuate a valve comprising the above-described spring or pneumatic valve. Thus, both manual and electric actuation mechanisms are known. Also, a dispenser system can be comprised of two or more containers, each of
