The server may be hacked, use a mirror.The present invention relates to a semiconductor memory device, in particular a synchronous dynamic random access memory (SDRAM), having a high circuit density, and a method of operating the same. There has been increasing demand for ever-denser semiconductor memories, in particular SDRAMs. SDRAMs permit an exceedingly high circuit density and typically operate at high speed. Accordingly, SDRAMs are very highly integrated. Known SDRAMs can be broadly classified into those that operate in synchronism with an externally applied clock signal, and those that operate in synchronism with an internally applied command. In the synchronous-type SDRAMs, a command is input in synchronism with a rising edge of a clock signal to write and read data. Synchronous-type SDRAMs have the advantage of being capable of easily transferring large amounts of data. In contrast, the synchronous-type SDRAMs have the disadvantage of being unable to freely write and read data when required. In order to increase the data transfer rate of the synchronous-type SDRAMs, it is necessary to increase the frequency of the externally applied clock signal, and to increase the number of clock signal inputs. Accordingly, both the SDRAMs 595f342e71
