Features Key:

New travel system. In the Lands Between, if you leave your current town, you can freely roam around within a range of the town you visited. This system is designed to avoid having to unlock a map screen for each town, and it allows you to enjoy the game while avoiding a world so large that it becomes hard to explore.

A new multiplayer function. In the current game, monsters appear when you get close to other users playing the online game, and become stronger the closer you get. While traveling with others, monsters would act the same as those in an offline game, and unlike multiplayer in the current game, it allows you to fight together without other game.

An offline function. In addition to global multiplayer, you can play the game offline and explore the world entirely by yourself while chatting with others. In the current game, it is challenging to synchronize the game between logged-in and non-logged-in users, so this function has been implemented to allow for this easier.

The new fantasy action RPG is a game that allows you to fight monsters and develop your character while enjoying an overwhelming story in the Lands Between. Come fight in the league of the brave for the glory of Elden!

See you in the game.Influence of dietary fructose on pancreatic and hepatic endocrine function and biliary excretion of amylase and lipase in conscious rats. The effect of fructose (F) in the diet on pancreatic exocrine and endocrine functions and biliary excretion of amylase and lipase was examined in conscious rats. Rats were divided into 2 groups: F-fed rats, in which F replaced 50% of sucrose, 50% of starch, and all the carbohydrate of the diet, and the control group, in which F was replaced in other carbohydrates of the diet. Fructose in the diet induced hypertrophy of the pancreas, hyperglucagonemia, hyperinsulinemia, and marked hyperamylasemia. Fructose in the diet also caused an increase of triglyceride and cholesteryl ester synthesis by the liver. Biliary concentrations of amylase and lipase were enhanced in the F-fed rats compared to controls, indicating that the secretion of these enzymes was accelerated in the F-fed rats. The amount of biliary amylase secretion increased with increased dietary F, and the biliary concentrations of amylase in the F-fed rats were higher than in controls even though the concentrations of hepatic amylase were the same in both groups. This finding suggests that intestinal factors, in addition to the hepatic synthesis and secretion, might participate in the secretion of amylase. The results indicate that the administration of dietary F influences the metabolism of pancreatic and hepatic and hepatic surgery helps in removing the fat and loose skin from different parts of the body. The procedure makes use of the electro-cautery instrument that is used to remove the unwanted fats in the body. The procedure requires surgeons to work out the location of the subdermal fat pockets, the internal fat pockets, and the internal skin and muscle layer. In this process, the area concerned is numbed and
