* **_Photoshop Elements_ :** Photoshop's versatile cousin, the creative software Photoshop Elements contains many similar tools and features. It costs less than $100. However, don't buy Elements just because it's cheaper than Photoshop; Elements' features are limited. * **_Corel PaintShop Pro:_** Photoshop elements is available as a separate application called Corel PaintShop Pro. * * * # Using the Quick Mask mode After you create an initial mask, you can edit it directly with the Quick Mask mode. You can switch to Quick Mask mode by clicking the Quick Mask icon in the upper left corner of the Layers panel. (The option is on the Channels panel but is hidden when the Tools panel is displayed.) When you switch to Quick Mask mode, the image previews in the Layers panel change to a solid color that represents the area of the image where you've defined the mask. You can click a part of the image to highlight it and then perform editing operations. When you finish your edits, click the Quick Mask icon in the upper left corner of the Layers panel to toggle back to the Normal mode for editing. * * * ## Creating Layer Masks A layer mask is a special type of mask where you provide an image that defines where you want the mask to appear and how it should appear. It differs from an alpha channel in that it's a true mask, not simply a set of transparency settings. A layer mask enables you to edit an image's colors without altering the transparency, which causes blending of the original color with the mask color. Layer masks offer many additional useful options, including the ability to paint inside the mask to create selections. To create a layer mask, follow these steps: 1. **In the Layers panel, select the object you want to mask. (You can select multiple objects with Ctrl+click or Shift+click.)** If you select a group of objects, you create a mask for all of them. 2. **Choose Layer** ⇒ **Layer Mask**. The Create a Layer Mask dialog box opens, as shown in Figure 1-4. 3. **Type a name for the mask in the Layer Mask dialog box**. Figure 1-4: To create a layer mask that will be applied to a selection, type a name for the mask in the Name text box.

Q: Is there any practical use for a prepaid cell phone? There are cases where you get a phone for free, but you've got to make a one-time up-front payment, with no service plan so you keep it for 30 days, which is about the longest time you'll ever have to use the phone. This is typical with cheaper phones from China or other emerging economies where you don't get much of a return policy. Is there any point in getting a cell phone for this situation? I don't have any say in what phone company I get it from and it may be an unlocked phone, which can't be sold and is only useable by a certain company. A: I have two prepaid Blackberry phones. I use them for the limited use that they allow. I get it: Prepaid phones are good for people who aren't in the habit of committing to a contract. People who might not be a "good candidate" for a contract phone. A: These can be a decent value for a lot of people who don't want a contract. They are also an option for people who don't want to commit to a 24/7 service at a 24/7 price for anything. You can use them as a cheap mobile phone service or you can use them as a cheap mobile phone service with web access. I think that a fair amount of us carry our phones with us all the time and just use them to check emails or surf the web. So, anything which doesn't need a smart phone like calendar, maps, voice mail or music is the ideal. If you plan to just use your phone as a cheap phone service for when you're away from home then I think they're a decent option. If you want a standard smart phone then I'd look elsewhere. I've had a cheap prepaid which we're now deleting. It's been good for the times when I've had to be away from home and I couldn't afford more than a plain old mobile phone for a few days. That said, I do use my office mobile which is on a contract so when I'm at home I don't really need a normal cell phone. A: Contracts have their uses for sure, and when they're not a choice, it's nice to know you can pay a certain amount for a certain number of calls or data, and get some free calls back if you need

Q: How can I pass a list of arguments to a function in Python? I have two Python scripts, a Python script and a shell script. I want to call a Python function from a shell script. The shell script and the Python script both use Python 2.7. The problem is that the shell script uses Python's subprocess module and Python's os module, but not ctypes. There are three reasons why I want to pass a list of arguments to a Python function. First, the Python function's argument list is a known at compile time. Second, there are many more Python scripts that use the Python function than there are shell scripts calling it. Third, I want the Python function to be able to use various modules, and the subprocess module allows it to do that. That is, I want the shell script to be able to pass a list of arguments to the Python function. I've tried various things, most of which were guesses. For example, this works in the shell script: subprocess.call(["/usr/bin/python2.7", "/home/user/Python/function.py", "command_string"]) But it doesn't work in Python, because in Python the first argument is the list of all the module names. For example, this script: import sys, subprocess sys.path.append("/home/user/Python") subprocess.call(["/usr/bin/python2.7", "/home/user/Python/function.py", "command_string"]) Runs without error, but none of the arguments to the Python function is passed to it. How can I pass arguments to a Python function in Python (either with sys.argv, subprocess or anything else)? A: Ok, I think I figured it out. Since the shell script is doing subprocess.call(["/usr/bin/python2.7", "/home/user/Python/function.py", "command_string"]), you can get a list of arguments by splitting the first argument: import sys, subprocess sys.path.append("/home/user/Python") args = subprocess.call(["/usr/bin/python2.7", "/home/user/Python/function.py", "command_string"], shell=True) arg_list = args
