NOTE: First time converting from ISO to DVD format using version 1.0 will cause the file to be corrupted.It is well known that electrical connectors are used to connect electrical devices to one another. Often, these connectors are used to electrically connect a circuit board to an electrical device, such as a microphone, an electrical outlet, etc. These connectors may be used to mount an electrical device to a wall, a ceiling, or other structure. Often, the electrical device is simply placed on a contact support, for example, on a wall, and the electrical connector is simply mounted to the contact support. The electrical connector often has several individual electrical contacts which are mounted to the contact support. Often, these electrical contacts have an insulation displacement portion with a length approximately equal to the distance between the electrical contact and the contact support. The electrical contacts are generally inserted into electrical connectors by pushing them from the top of the electrical connector into a receiving cavity. The electrical connector contacts are either bent over or crimped to provide secure mechanical and electrical connections. When these electrical connectors are used to mount a microphone to a contact support, the microphone is usually mounted directly to the electrical contact. However, various mounting techniques have been developed that enable the microphone to be mounted on the electrical connector first, and then mounted to the contact support. For example, it is known to use a mounting bracket to attach the microphone directly to a contact support. However, these mounting brackets are complex and expensive. Additionally, depending upon the particular microphone, it may be desirable to adjust the microphone's tilt or angle with respect to the contact support. This often requires the microphone be tilted or angled with respect to the contact support. It is also known to mount the microphone to a mounting plate. The mounting plate may be mounted to a contact support. However, the mounting plate is often designed for a particular microphone such that it may not be easy or convenient to interchange different microphone types. It is also known to mount the microphone to a mounting rail. A mounting rail is attached to a contact support. The mounting rail may be fastened to the contact support or may slide into position into the contact support. The mounting rail may

have a raised portion on which the microphone is mounted. However, the mounting rail is normally designed for a particular microphone. Thus, the microphone may be mounted only to the mounting rail with a minimum of motion. Additionally
