Adhesions of the cervical and intracranial structures represent a frustrating and persistent problem for both neurosurgeons and otorhinolaryngologists. We present a prospective study describing the technique of combined endoscopic and open adhesiolysis for the management of cervical and intracranial adhesions in patients with severe headache, neck pain, and neurological deficit. Fourteen consecutive patients underwent combined endoscopic and open adhesiolysis by the senior author. Diagnoses included prior myelography (n = 12), previous surgical procedures (n = 4), and prior attempts
