Like Smalltalk, Centro did not have objects as the first-class programming construct; rather, the language is "imperative" and had a restricted set of first-class programming constructs similar to ALGOL 68. It had named variables and a recursive programming language. Centro was used for the development of the Mariner-NASA Topographic Orbiter. The system comprised a number of components - including a built-in editor, the Mariner Analysis Language, and a command interpreter. The Centro manual is still available online.
