conversion solution. Key Features: Multifunctional file.Q: Logistic
Regression: Reporting P-value for model selection I have trained a
logistic regression model for predicting depression (using LibSVM)
for my data. I am using ROC, area under curve to select the best
model among 50 models. I want to know how to get P-value so
that I can use that in model selection criteria. Is there a way to get
P-value? Sample Data: `sample = data.frame("id" = sample(1:4,
size = 12, replace=TRUE), "depression" = sample(0:1, size = 12,
replace = TRUE), "previous_treatment" = sample(0:1, size = 12,`

```
replace = TRUE), "treatment_received" = sample(0:1, size = 12,
      replace = TRUE)) #Remove NAs
sample=sample[complete.cases(sample), ] #Imports training data
sample$depression=factor(sample$dep 648931e174
```
