While the primary function of AutoCAD is to create and edit 2D drawings, it can also create 3D drawings and computer models. The software includes tools for managing drawings and for the creation of standards-based documents. For more information, see Aids & Dtdances. AutoCAD offers the most comprehensive package of 2D drawing tools available. It can create two-dimensional drawing files from scratch, create editable 2D or 3D drawings or computer-aided design (CAD) models, and enhance 2D drawings. Architecture Architectural drawings are produced with the aid of computer-aided design (CAD) software and are an essential tool in the building industry. Product models are the first stage in the production of working models. A working model is a computer-generated three-dimensional model, consisting of sections, elevation, and perspective views, which are ultimately used to create a full-scale working model of the building, which is of a similar scale and construction to the working drawings. By the time the working model is ready, it is generally too expensive to order a cast model, and it is a requirement to have as exact a model as possible. Working models are normally used during construction, when the model can be taken apart to expose any defects that have developed. When the building is sufficiently completed, the working model is then used to create the set. Architectural 3D models may be static or dynamic. An architectural 3D model is one that can be viewed in the normal way. If the architectural 3D model is made from 3D solid modeling, then the model may have a solid color surface representing a wall or window. Dynamic architectural 3D models are ones that are created from a series of 3D models that are then animated together to create a film or video. They may be created by taking an image of the 3D model. With a traditional 3D image, the software then builds a series of animated frames of that image. This can be used as a film or video. Or the software may be used to generate animation, which is then placed on top of a video background. A CGI (computer generated image) is similar to a traditional 3D image, but the actual 3D model is not seen. Instead, the model is designed in a pre-rendered, animated, CGI format and viewed on screen. Architectural 3D models are used in a number of ways. For example, they can be used to make illustrations of buildings, such as photographs of architects' schemes or computer-generated animations of buildings, they can be used to create floor plans and more detailed visualizations of the space, and they can be used to create 3D models of computer graphics 3D applications or 3D printers can be used to render a 3D model and create a printed model, which can be used as a scale model. A more detailed, solid-based, model can then be used to create a more accurate model for specific tasks. For example, the model can be used to ca3bfb1094
