AutoCAD is the top-selling 2D CAD application in the world, with approximately 2.5 million units sold annually, up from 2 million units in 2010. AutoCAD is used in most industries to create and edit engineering and architectural drawings. AutoCAD is not just for architects and engineers, however, as it is also a popular drafting tool for freelancers and hobbyists. In fact, the majority of users are not professional architects or engineers. AutoCAD is widely used in many industries, such as industrial manufacturing, architecture, landscape design, mechanical design, education, home design, etc. Why buy AutoCAD? There is increasing evidence that chronic pain can present a challenge for elderly people. To describe the biopsychosocial pain trajectories of elderly individuals with chronic pain and to compare these trajectories with those of their pain-free counterparts. A community sample of 818 participants aged 65 years or over was assessed for chronic pain (e.g. back pain, leg pain) and depression, anxiety and psychological distress, at baseline and 4-year follow-up. Latent growth curve modelling (LGCM) was used to identify distinct and identifiable trajectories of pain and psychological outcomes in pain-free and chronic pain groups, as well as the role of sex and baseline pain severity in predicting subsequent pain outcomes. A total of 320 individuals (18.1% of the sample) reported chronic pain at 4-year follow-up; the majority (78.3%) of chronic pain individuals had back or neck/shoulder pain, and 42.5% reported depression, anxiety and/or psychological distress. Three distinct trajectories of pain and psychological outcomes were identified. Chronic pain was not associated with elevated psychological distress or with improved psychological outcomes over time. However, men were found to have higher rates of chronic pain than women and lower levels of psychological distress at follow-up. In elderly people, chronic pain was associated with poorer psychological well-being, but not with elevated rates of psychological distress. The invention relates to a connecting rod for a friction clutch, having a guide bush. DE 35 19 936 C1 shows a connecting rod for a friction clutch in which a small internal space is provided between the bore of the guide bush, into which the pinion gear is placed, and the guide bore, into which the piston-rod of the friction clutch is inserted. The friction clutch is normally operated with a friction lining. The friction lining is pressed onto the friction linings of the piston and the control slide. These are
