Download.Sector, a Brooklyn-based startup developing fiber-optic network technology, is now marketing their initial product to ISPs, cellular and enterprise service providers, as well as municipal and utility users. While the company has been beta testing its platform with wireless and land-line customers over the past year, the following has been scheduled for launch later this month: -- a residential and small business service that is an alternative to DSL. The service will offer either up to four broadband Internet connections, or two connections for up to four "data centers" [separate data/IP connections run through a single fiber optic cable]. A typical connection will cost about \$50 per month. -- land-line service that will provide customers with a dedicated circuit, and provide as many as 100 megabits of throughput. A typical 1 Gbps

connection would cost about \$50 per month. -- enterprise services.

The company is working on a service that would offer high-speed data and a dedicated circuit to customers. The service would be available to companies with 2,000 to 50,000 users.

"Sector's fiber network connections are very low latency and offer a flexible architecture," said CEO and co-founder Aaron Ekins. "They're built from the ground up for applications such as the Internet and video, and they're way cheaper than DSL and cable." The company's current generation network uses low-cost micro-optics technology to provide low-latency and less complexity than DSL. The structure resembles a scaled-down version of a microwave wireless system, with more than 90 fiber pairs extending between a network's hubs. Sector's technology focuses on providing

"smart networks" that, for example, are able to drop broadband connections during a wireless event in order to avoid using network resources for unneeded activities. The company has also developed technology that allows a local switch to monitor the condition of the cable infrastructure and proactively activate "healthy life" networks to avoid outages. The "fiber network connections" as the company refers to them, are designed to be very low-latency (less than 250 milliseconds), providing low-jitter and/or low-packet loss. The company has also developed
