Motion After the introduction of Flash, the Motion group turned to a different way to enhance animation. Adobe created tools that enable you to make movies.

Unfortunately, these tools are not yet ready for the masses. You can, however, make your own movies by importing Flash movies or video formats. Adobe offered paid, professional solutions for animating Flash, such as Adobe Edge Animate. *

Conventionally, a flow path for a sheet material, for example, a ceramic green sheet for an electronic component substrate is constituted of a manufacturing

line to which a cleaning nozzle having a nozzle hole is attached for cleaning the sheet material in the manufacturing process. For example, there is described a flow path for a sheet material having a cleaning function that a nozzle hole direction of the cleaning nozzle is shifted by 90 degrees with respect to the flow direction of the sheet material in the manufacturing line to extend in the flow direction of the sheet material. In addition, for example, there is described a flow path for a sheet material having a cleaning function in which in an atmosphere where a partial pressure of a component having an effect of deodorization exists, a nozzle hole direction of a cleaning nozzle is shifted by 30 degrees with respect to the flow direction of the sheet material in a

manufacturing line to extend in the flow direction of the sheet material. In recent years, an electronic component having a micro structure has been requested, and there is used a ceramic green sheet for an electronic component (substrate) having a fine structure obtained by a press forming using a die formed in a material such as a nickel-based material, a stainless steel, a titanium material, and a zirconium material in place of the nickel-based material. There is a problem that since a die material having a certain shape is abraded in the press forming, the die becomes a defect in the manufacturing process when a large number of press forming steps are performed, and the yield is reduced. Accordingly, there has been developed a method to suppress the defect

by forming a thin plate in addition to a base material such as a stainless steel. For example, there has been developed a method for forming a thin plate by removing a part formed in a base material by the press forming of the base material, or a method for forming a thin plate by locally removing a base material in a part that the part is likely to be eliminated in an ordinary press forming by a high precision press-molding (see Patent Document 1). In addition, for example, there has been developed a technique in which upon placing the base material in a mold for press forming, a block material is attached to a pressure distribution surface in advance, and a thin plate is formed by removing the block material by the press forming (see Patent Document 2). In

addition, there has been developed a technique that a thin plate is formed by removing a part formed in the base material by the
