PURPOSE. This study evaluated the accuracy of an ultrasonographic (US) method to measure the distance from the centre of the femoral head (FH) to the joint surface. METHODS. US and CT measurements of the FH-to-joint surface distance were obtained from the femoral head in 15 cadaveric specimens. The measurements were obtained by two surgeons. All specimens were dissected to assess the accuracy of the US method. RESULTS. Mean +/- SD distance from FH to joint surface using US was 2.3 +/- 2.9 mm. CT and US measurement distances were highly correlated (r = 0.99). All US methods achieved the 0.15 mm-0.20 mm accuracy objective. CONCLUSIONS. US proved to be a reliable, safe, and noninvasive method to measure the FH-to-joint surface distance. all other words, a teenager in California was "i gotta drink Beer".
