I read a strange class that has a finalizer for each property (causing a memory leak). I know, I know, there is no such thing, but I cannot understand how it is possible. Is it possible to put finalizers in a C# class? If so, where? A: There's a little trick you can do to find the finalizer. Open up the Disassembler and use the Method keyword parameter, and search for the class type in the Reflector. The method is called BeforeFinalizeInternal. That's the code that runs in the finalizer. If you do that, you'll find that in class, the finalizer is an override of the protected virtual void Dispose(bool) method. In particular, the constructor (in the superclass) calls into the base class. A: Preliminary note: this answer is for .NET 2.0, which means it does not work for .NET 4.0. .NET 2.0 does not have any intrinsic mechanism for implementing finalizers. In order to implement a finalizer, you have to implement the Disposable.Dispose interface directly. Once you do this, then you can create a finalizer via the CreateFinalizeDelegate() method. .NET 4.0 has a new mechanism, which hides this requirement from you. Before C# 4.0 finalizer implementations were inherently dangerous. This new mechanism is called Lazy. So you use Lazy instead of creating your own implementation of IDisposable.
