Culina: Hands In The Kitchen Ativador Download [torrent Full]The invention relates to a method for controlling a balance shaft of an automatic transmission in a motor vehicle, in particular in a transversely equipped motor vehicle. The invention furthermore relates to a balance shaft of an automatic transmission, in particular a transversely equipped automatic transmission of a motor vehicle, comprising a shaft and a transmission gearbox connected to the shaft, which contains at least one shift rod, and at least one balance shaft positioned behind the shift rods. In the case of an automatic transmission as described above, it is known that the balance shaft is connected to the transmission shaft via a gearbox which can be shifted, but it must be protected against material deformations of the transmission gearbox. For this purpose, the balance shaft is additionally equipped with a number of rollers in the transmission gearbox, which rollers run on a toothed ring surrounding the balance shaft, hereinafter also called balance shaft ring. Against this background, it is the object of the present invention to configure a method and the balance shaft for an automatic transmission with which the balance shaft can be controlled to an optimum degree as independently as possible from other components of the automatic transmission. In order to achieve this object, the method according to the invention is distinguished from the state of the art by the fact that the balance shaft, at a uniform time, is moved relative to a shift arm of the automatic transmission such that the influence of the non-moving transmission components on the speed of the balance shaft is reduced. The invention proceeds from the known control methods of automatic transmissions. In accordance with the present invention, the rolling transmission components of the automatic transmission are used for moving the balance shaft. The rolling transmission components comprise a ring gear which is connected to the transmission shaft of the automatic transmission and a shifting gearwheel which can be rotated by a corresponding shift arm of the automatic transmission. At the same time, it is ensured that the transmission gearbox containing the shift arm is positioned at a distance from the rolling components. Consequently, the balance shaft of an automatic transmission does not have any rolling transmission components which are loaded in addition to the balance shaft, and which are detrimental to the rolling movement of the balance shaft. In the preferred configuration of the method according to the
