Restaurant. Bioelectrical
impedance analysis in
European children and
adolescents. The objectives
of the study are to establish
the reliability and validity of
bioelectrical impedance
analysis (BIA) and to
describe its use in the
assessment of body
composition and fat-free
mass in an adolescent
population. Sixteen healthy
subjects, 8 boys and 8 girls

aged 16.7 +/- 2.1 years, were studied. Eight subjects were overweight, of which 4 were obese. Height, weight and body composition by means of BIA and underwater weighing (UWW) were determined. Reliability was good for height, weight, body fat percentage and fat-free mass ($r = 0.98, 0.87, 0.96$ and 0.94 , respectively), and excellent for fat mass ($r = 0.95$). The agreement of the two methods showed an over estimation of fat mass

(BM) in obese children, but
the agreement was not
statistically significant
