
Download Wincc 7.2 Full Crack [REPACK]

7.2. Tag data type. Introduction. Define the required tags for the logical connection. From the WinCC point of view, you can access to any block attribute without extracting it. For this, the GetAttributes function is used. For example, you can get a tag attribute for a block in memory by simply setting its value in the GetAttributes function (and, of course, setting its value in all other functions). In this case, all the attributes of this block will be displayed in memory, which is very convenient. In order to access the attributes of a block, you must define the block that contains this tag. This is done using the GetBlockAttribute function.
