this paper focuses on the development and the evaluation of an integrated neural network-support vector machines (nn-svm) system for predicting the sensitivity of an underground coal mine to mining disasters. an artificial neural network (ann) was constructed to process features from different types of sensors and mine environment. the developed nn system was evaluated for predicting the sensitivity of coal mines to mining disasters. this study aimed to evaluate the effectiveness of the endodontic rotary niti files (reciproc, k3 and waveone) in comparison with the stainless steel hand files (size 40, gates glidden) for removing the residual gutta-percha from the root canals of human permanent mandibular molars. thirty single-rooted human mandibular first permanent molar teeth were selected for this study. vertucci's method was used to determine the tooth root canal system anatomy. the crowns were removed from the coronal area, and the root canals were prepared using four different endodontic rotary files-reciproc, k3, waveone and hand files-and then obturation was carried out using the cold lateral condensation technique. after apical patency was achieved, the teeth were sectioned at 2 mm above the cemento-enamel junction, and scanning electron microscopy (sem) images were taken and compared. in comparison with other rotary files, the waveone had the greatest ability to remove the gutta-percha from the root canal. this study demonstrated that the new endodontic rotary files had an ability to clean gutta-percha from root canals. however, further clinical studies are necessary.

previous studies on the thermal analyses of ceresin composites have reported limited heat generation during clinical application. the aim of this study was to determine the temperature rise of three types of composite with adhesives and conventional flowable composite using a digital periapical thermocouple. the amount of heat generated by the composites during the polymerization process were measured using a digital dental hand piece. the temperature of the tip of the tip of the hand piece was measured continuously for 20 s. the temperature of the composite was measured with the tip of the hand piece 1 mm away from the cemented amalgam. the composite surface temperature was measured with the tip of the hand piece 20 mm away from the cemented amalgam. the temperatures were determined at three time points - immediately after the polymerization of the composite and at 5 and 30 seconds after the polymerization. the results indicate that the type of composite used influences the temperature rise during polymerization. statistically significant differences were found among the three types of composite regarding temperature rise at 5 seconds, and 30 seconds. in addition, the temperature of the tip of the hand piece was significantly higher than the surface temperature of the composite (p 5ec8ef588b
