Serious Photoshop users often turn to third-party software if they find themselves overwhelmed, having to do more than they would like to with Paint Shop Pro, Photoshop Elements, or the like. The program is an Illustrator utility that acts as its own vector graphics editor, including the ability to draw basic shapes using a tablet. However, it can also provide additional layers, transformations, and blending, letting you work on a drawing on its own surface. In addition, it has the ability to save files as JPEG, GIF, PNG, and TIFF. Adobe makes popular image editing programs called Adobe Photoshop and Photoshop Elements, the latter being a stripped-down version of the former. The two programs use the same underlying technology, as does the Adobe Acrobat line of products. Pickled vegetables are the only thing Photoshop allows to survive an uninstall process. Being one of the flagship product for Adobe, Photoshop is almost impossible to match if you serious about professional image editing. Before Photoshop, software companies had their own editing software like Corel Photo-Paint or CorelDRAW, and these software were very good. But if you wanted to make a lot of changes, you would get into a whole lot of trouble with these software. So Photoshop replaced them all, and honestly, it has been a very good thing. Because of its wide user base, paid and free versions, Photoshop is one of the most popular software to learn, even though it is not the easiest software to use.

So how do you do this in Photoshop? The process is fairly simple, and it's largely determined by a couple of features found in the toolbar: the Curves tool and the Hue/Saturation tool. These tools are somewhat similar, but they actually do a very different job. The Curves tool is used to modify the overall balance of color in your image and to correct any visual defects that may have been introduced by exposure or processing. I **highly** recommend using this tool when you get the chance because it's a powerful tool that can quickly make your image look much more balanced and professional. Begin by clicking on the Curves tool to open the active toolbox. Then click on the Curves tool, and click and drag the slider upward in the window until you get to the middle of the window. This will increase the amount of mid-tones in the image. With this tool you can create a gradient of any hues or shades to achieve quite a precise effect. To create, adjust, and remove gradients, you must first create a gradient on your image. This is accomplished by preselecting the Foreground color (what the gradient will actually be applied to), then clicking the gradient preset tool located in the gradient toolbox and selecting your gradient. Often times, a preset gradient like Mid-Tone works best, but you can also create custom gradients if you prefer. The mid-tones on your image will likely be too bright or too dark. These areas are referred to as Curves. Since the mid-tones on your image need to be the lighter level, you'll need to adjust the curve to get them in balance. To do this, click on the Curves tool and then click +. Once in the Curves tool, click on the dot in the middle of the popup window (it looks like a small triangle) and drag the left edge of the curve upward until you are happy with the adjustments. Then, to adjust the right side of the curve, click on the arrow icon and drag the right side of the curve downward to balance out the image. 933d7f57e6
