File Browser has seen several usability improvements over the last two versions, including a new "Create a New Folder" option. There's also a "Quick Access" tool that allows you to select a part of the image while in the image window, which is really convenient. A "Scale Image" feature means that you can align your image to the edges of your canvas if you have an extra-large monitor. For example, when a photo is too big for my 1024 x 768 monitor and I need to crop it, I now can just pinch to zoom in on the right and left sides and the image will automatically align itself to the largest rectangle it can. Camera RAW has a handful of new features, such as a new noise reduction tool that can be accessed solely from the workspace. When applied, the noise reduction process will fade the noise with a gradual gradation that makes the noise impossible to see. An image preview that shows tone and highlight curves can be turned on or off in the dialog boxes. One of the last things I tested with Lightroom 4 was the "Create Events" function, which enables you to create a new event with digital "checks" for options such as time stamp, location, and notes. Adobe makes it easy to attach sound with each check. I checked the "Create" dropdown to determine all the options available and was pleasantly surprised when the software announced it was creating 10 new events at once. Given that Lightroom CC allows multiple editing projects, I was curious about how projects would cross-pollinate the way they had in previous versions. For example, a project file might let you view a person's photos on the first day and then on the second day use the photos to create a second project. I wasn't prepared for just how flexible the system is.

If you have difficulty using Photoshop or if you want to edit and enhance your photos with Adobe Photoshop's features but don't want to spend years learning the program, you'll find the information you need in this book.
