OEE Toolkit Crack +

The OEE concept can easily be understood, as it is based on the simple idea of 'to get the same performance from your machinery, you need to make sure you have everything in good shape. We have developed a tool that determines the capacity of your machinery, based on a database of machines and the data of machine operation and maintenance. You have the ability to obtain the OEE values for each of your machines. You can export the results to Excel spreadsheets. The tool will also help you obtain the downtime of your machinery and the estimated repair costs. OEE Toolkit is the best product for both large and small companies. Download the sample version and make your choice. Description: OEE Toolkit offers the facility of assessing the machinery effectiveness and capacity of your production machinery. This tool is based on a database of machines and data of machine operation and maintenance. OEE Toolkit is a complete package that includes: · Inventory analysis and stock check · Machine analysis and capacity calculation · Routine maintenance and advice for the manufacturer, · Model standardization and advice for the production manager. · The standardization and quality control of components and machines. There are two versions of the tool: o Standard version, which includes all standard data and calculation tools o Custom version, which allows you to make changes in the database, according to your needs. Extended description of the concept: The machinery effectiveness, or the Overall Equipment Effectiveness (OEE), is a concept that provides reliable and useful information on the most important part of a production facility - production machinery. OEE is a ratio that represents the ability of the production machinery to produce output (ex. produced amount). This ability can be defined as the output produced per hour of operation. This can be directly measured by collecting the time it takes to produce the required amount of output, and measuring the output produced. If you can get the same amount of output, in the same time, with a different output, you can say that you have greater effectiveness. This concept also can be measured in relation to the type of output, and by the technology used in production. The concept is suitable for measuring the production machinery, e.g. to assess and improve the productivity and capacity of your production machinery, to assess and manage the machinery capacity and to assess the performance and efficiency of the factory. The results
