### **What is the Difference between Pixel Preview and Real-Time Preview?**

You'll notice that you have a small preview in the top-right corner of your image while you are working on an image. This is the pixel-level preview. However, you also have a larger real-time preview in the bottom-right of your image. You can change what part of your image is previewed by clicking and dragging the corner of the view, or simply select it by using Shift + click. You can adjust the size of your real-time preview by sliding your mouse to the right. You can also, as mentioned previously, double-click the top-right corner of your image to reset your image size. The Gradient tool allows you to either flatten a copy of your image and place it as a new layer, or layer individual colors within the image. The Gradient tool is great for applying various shadings and gradients. The Eraser tool is there to delete your mistakes, from using the Clone tool. You can select the areas of your image and click and drag over them to automatically delete them. Erasing unwanted sections of your image will help to save space within it. **What is the Healing tool?**

The Healing tool allows you to perfect the blemishes in your image. It's very helpful when you accidentally select an area of your image that shouldn't be there. If things start to get a little too fiddly, it's possible to hide certain properties when you want to work on your layer. This is as easy as highlighting your layer and then editing the **Layer Style** option. e3d0a04c9c

In order to get the results, you must be careful that you apply the layer to the same area and place its layer contents the same as the last one.
