The most powerful feature in the next major release, and one that I've never used, is the new "smart video" format. It works much like the smart photo format, blending seamlessly into almost any other video project. The key difference between a smart video and a smart photo is that you can't see a smart video preview while you work. It's a "black hole" in your video timeline. It's useful only in the sense that you can see what you're doing in your project and pull it into different comps as needed. You're looking at an order form for rising cabs in an airport. Then you decide to change the images of the buildings to an environment with trees and whatnot. You open a tab where you can change all of those images at once using the best features of Photoshop. For example, you can change the color of a color chart or a color layer, change the colors themselves or leave them unchanged, adjust the opacity of the color layer or leave it unchanged, change the hue of the color layer when it moves diagonally, reduce the size of a layer without losing quality by modifying its actual pixels, add additional instances and more. You can modify an image as if you were saving a new instance of an image instead of editing the original. Adobe Photoshop CC 2015 comes with lots of new features in just a single package. For example, its in-built file browser has the new search utility. Now it takes less time to find any file in your hard disk even if you had hidden this file from the previous version. The Photoshop also comes with layers preset panel and Photoshop Monitor panel, which

helps you to edit in more than one working session when you import the files into your project.
